Machining Productivity Improvement May 27 2022 Improvement of productivity is need of the hour for overall growth and development of an organization. The present work deals with a problem of low production tractor industry. The machining operation being one of the most important stages in manufacturing of various components has been focused in the present work. A thorough study of existing process plan revealed that there is enough scope of improvement in cycle time by modifying fixtures and cutting tools. The study has been carried out by identifying the machining of two critical components. About 30% Cycle time has been reduced by modifying jigs & fixtures and by implementing latest cutting tools. Fixture has been modified to accommodate 8 Cylinder Heads at time, Cutting tools with improved geometry and TiAlN coating. After implementing the modifications 41 % improvement in machining productivity has been achieved for Cylinder Head and 20% reduction in machining cost of one Cylinder Head. Machining cost of one Main Transmission Housing has been reduced by 16%. Further this study has resulted in annual savings of approx. Rs. 6.5 lakh and Rs.5 lakh in case of Cylinder Head and Main Transmission Housing respectively.

Reconfigurable Manufacturing Systems and Transformable Factories Jan 29 2020 Dear reader! In your hand you have the second book from the series “XXI Century Techno- gies.” The first book under the title “Manufacturing Technologies for Machines of the Future” was published by “Springer” in 2003. This book is aimed at solving one of the basic problems in the development of modern machine-building – working out of technologies and manufacturing equipment which would promote the continuous development and improvement of the final product design, rapidly “adaptable” to the requirements of the market as for the quantity, quality, and variety of products manufactured with the lowest cost and minimum time and labor of the product process. In this book the problems of theory and practice of development in the reconfigurable manufacturing systems and transformable factories for various machine-building branches with a focus on automotive industry are discussed. The problems concerning the development of a new class of production systems which in comparison to the flexible manufact- ing systems are composed of a far less quantity of

machine-tools (reduced cost of production) are discussed. In comparison to the conventional automated lines (dedicated systems) they make it possible to rapidly transform the equipment for new products manufacturing. The book has some advantages concerning the art of scientific ideas and the presentation of developments.
